# Topological entropies of subshifts of finite type in amenable groups. 

Sebastián Barbieri Lemp<br>University of British Columbia

Symbolic Dynamical Systems<br>May, 2019

## At the dawn of time

## At the dawn of time

There was ergodic theory.

## At the dawn of time

There was ergodic theory.

Everybody was happy, and many theorems were proven.

## At the dawn of time

There was ergodic theory.

Everybody was happy, and many theorems were proven.
... However, they kept a shameful secret!

Consider

- $\mathbb{Z} \curvearrowright X=\{0,1\}^{\mathbb{Z}}$ with the Bernoulli measure $\left(\frac{1}{2}, \frac{1}{2}\right)$.
- $\mathbb{Z} \curvearrowright Y=\{0,1,3\}^{\mathbb{Z}}$ with the Bernoulli measure $\left(\frac{1}{3}, \frac{1}{3}, \frac{1}{3}\right)$.

The secret: ergodic theory cannot tell them appart.

Consider

- $\mathbb{Z} \curvearrowright X=\{0,1\}^{\mathbb{Z}}$ with the Bernoulli measure $\left(\frac{1}{2}, \frac{1}{2}\right)$.
- $\mathbb{Z} \curvearrowright Y=\{0,1,3\}^{\mathbb{Z}}$ with the Bernoulli measure $\left(\frac{1}{3}, \frac{1}{3}, \frac{1}{3}\right)$.

The secret: ergodic theory cannot tell them appart.
Why: the Koopman operator of a system $(G \curvearrowright X, \mu)$ is

$$
\kappa_{X}: G \rightarrow \mathcal{B}\left(L^{2}(X)\right)
$$

given by

$$
\kappa_{X}(s)(f)=f \circ s^{-1}
$$

And it happens that

$$
\kappa_{X}, \kappa_{Y} \text { are equivalent to } 1_{\mathbb{Z}} \oplus \lambda_{\mathbb{Z}}^{\oplus \mathbb{N}} .
$$

## The age of heroes

## The age of heroes

But then, Kolmogorov and Sinai stole fire from the gods and gave it to humanity.

## The age of heroes

But then, Kolmogorov and Sinai stole fire from the gods and gave it to humanity.
(Fire $=$ Measure theoretical entropy theory)
And they showed that it was an invariant under isomorphism.

## The age of heroes

But then, Kolmogorov and Sinai stole fire from the gods and gave it to humanity.
$($ Fire $=$ Measure theoretical entropy theory)
And they showed that it was an invariant under isomorphism.

This was great:

## Theorem (Ornstein, 70.)

Two Bernoulli shifts are isomorphic if and only if they have the same entropy.

## The age of heroes

A topological version of entropy was introduced in 65' by Adler, Konheim and McAndrew.

## The age of heroes

A topological version of entropy was introduced in 65' by Adler, Konheim and McAndrew.

Let $G$ be amenable, $\left(F_{n}\right)_{n \in \mathbb{N}}$ a FøIner sequence, $\mathcal{U}$ an open cover of $X$ and $N(\mathcal{U})$.

$$
h_{\text {top }}(G \curvearrowright X)=\sup _{\mathcal{U}} \lim _{n \rightarrow \infty} \frac{1}{\left|F_{n}\right|} \log N\left(\mathcal{U}^{F_{n}}\right)
$$

## An annoying question

Annoying question
Given a countable class of dynamical systems. What values can their topological entropies take?

## An annoying question

## Annoying question

Given a countable class of dynamical systems. What values can their topological entropies take?

## Some answers

- $\mathbb{Z}$-SFTs [Lind, 84] Non-negative rational multiples of logarithms of Perron numbers.

## An annoying question

## Annoying question

Given a countable class of dynamical systems. What values can their topological entropies take?

## Some answers

- $\mathbb{Z}$-SFTs [Lind, 84] Non-negative rational multiples of logarithms of Perron numbers.
- $\mathbb{Z}^{d}$-SFTs, $d \geq 2$ [Hochman and Meyerovitch, 10] The set of non-negative upper semi-computable numbers.

## An annoying question

## Annoying question

Given a countable class of dynamical systems. What values can their topological entropies take?

## Some answers

- $\mathbb{Z}$-SFTs [Lind, 84] Non-negative rational multiples of logarithms of Perron numbers.
- $\mathbb{Z}^{d}$-SFTs, $d \geq 2$ [Hochman and Meyerovitch, 10] The set of non-negative upper semi-computable numbers.
- Effectively closed $\mathbb{Z}$-subshifts. The set of non-negative upper semi-computable numbers.

## Goal of this talk

## Even more annoying question

Let $G$ be a countable amenable group. Characterize the set $\mathcal{E}_{\mathrm{SFT}}(G)$ of entropies attainable by $G$-SFTs

## Two simple remarks

## Trivial realization result

If $G$ is a countable amenable group and $H \leq G$, then

$$
\mathcal{E}_{\mathrm{SFT}}(H) \subseteq \mathcal{E}_{\mathrm{SFT}}(G)
$$

## Two simple remarks

## Trivial realization result

If $G$ is a countable amenable group and $H \leq G$, then

$$
\mathcal{E}_{\mathrm{SFT}}(H) \subseteq \mathcal{E}_{\mathrm{SFT}}(G)
$$

## Computability bound

If $G$ is a finitely generated amenable group with decidable word problem, then

$$
\mathcal{E}_{\mathrm{SFT}}(G) \subseteq \mathcal{E}_{\mathrm{SFT}}\left(\mathbb{Z}^{2}\right)
$$

## A simple consequence:

$G$ is polycyclic if there exists a sequence of $N_{i}$

$$
G=N_{0} \triangleright N_{1} \triangleright \cdots \triangleright N_{n} \triangleright N_{n+1}=\left\{1_{G}\right\} .
$$

such that every quotient $N_{i} / N_{i+1}$ is cyclic. The Hirsch index of $G$ is the number of infinite quotients in such a series.

## A simple consequence:

$G$ is polycyclic if there exists a sequence of $N_{i}$

$$
G=N_{0} \triangleright N_{1} \triangleright \cdots \triangleright N_{n} \triangleright N_{n+1}=\left\{1_{G}\right\} .
$$

such that every quotient $N_{i} / N_{i+1}$ is cyclic. The Hirsch index of $G$ is the number of infinite quotients in such a series.

## Theorem (B., 19.)

Let $G$ be a polycyclic-by-finite group and denote by $h(G)$ its Hirsch index.
(1) If $h(G)=0$ then $\mathcal{E}_{S F T}(G)=\left\{\left.\frac{1}{|G|} \log (n) \right\rvert\, n \in \mathbb{Z}_{+}\right\}$.
(2) If $h(G)=1$ then $\mathcal{E}_{S F T}(G)=\mathcal{E}_{S F T}(\mathbb{Z})$, the set of non-negative rational multiples of logarithms of Perron eigenvalues.
(3) If $h(G) \geq 2$ then $\mathcal{E}_{S F T}(G)=\mathcal{E}_{S F T}\left(\mathbb{Z}^{2}\right)$, the set of non-negative upper semi-computable numbers.

## Something a little bit more interesting

## Theorem (B,. 19.)

Let $G$ be a finitely generated amenable group such that

- G has decidable word problem.
- $G$ admits a translation-like action by $\mathbb{Z}^{2}$.

Then the set of entropies attainable by G-subshifts of finite type is the set of non-negative upper semi-computable numbers.

$$
\mathcal{E}_{S F T}(G)=\mathcal{E}_{S F T}\left(\mathbb{Z}^{2}\right)
$$

## Translation-like action

$H \curvearrowright G$ is translation-like if
(1) $H \curvearrowright G$ is free. $h \cdot g=g \Longrightarrow h=1_{H}$.
(2) $H \curvearrowright G$ is bounded.

$$
\left\{(h \cdot g) g^{-1} \mid g \in G\right\} \text { is finite for every } h \in H
$$

## Corollaries

## Products of f.g. groups

If $G_{1}, G_{2}$ are f.g, amenable, and have decidable word problem, then

$$
\mathcal{E}_{\mathrm{SFT}}\left(G_{1} \times G_{2}\right)=\mathcal{E}_{\mathrm{SFT}}\left(\mathbb{Z}^{2}\right)
$$

## Corollaries

## Products of f.g. groups

If $G_{1}, G_{2}$ are f.g, amenable, and have decidable word problem, then

$$
\mathcal{E}_{\mathrm{SFT}}\left(G_{1} \times G_{2}\right)=\mathcal{E}_{\mathrm{SFT}}\left(\mathbb{Z}^{2}\right)
$$

Products of countable, non-locally finite groups
If $G_{1}, G_{2}$ are countable, amenable, non-locally finite and admit a presentation with decidable word problem, then

$$
\mathcal{E}_{\mathrm{SFT}}\left(G_{1} \times G_{2}\right)=\mathcal{E}_{\mathrm{SFT}}\left(\mathbb{Z}^{2}\right) .
$$

## Corollaries

## Products of f.g. groups

If $G_{1}, G_{2}$ are f.g, amenable, and have decidable word problem, then

$$
\mathcal{E}_{\mathrm{SFT}}\left(G_{1} \times G_{2}\right)=\mathcal{E}_{\mathrm{SFT}}\left(\mathbb{Z}^{2}\right)
$$

Products of countable, non-locally finite groups
If $G_{1}, G_{2}$ are countable, amenable, non-locally finite and admit a presentation with decidable word problem, then

$$
\mathcal{E}_{\mathrm{SFT}}\left(G_{1} \times G_{2}\right)=\mathcal{E}_{\mathrm{SFT}}\left(\mathbb{Z}^{2}\right)
$$

## Branch groups

If $G$ is an infinite, f.g, amenable branch group with decidable word problem (ex: Grigorchuk group), then

$$
\mathcal{E}_{\mathrm{SFT}}(G)=\mathcal{E}_{\mathrm{SFT}}\left(\mathbb{Z}^{2}\right)
$$

## Group charts

To prove the main theorem, we need to introduce group charts.

## Group charts

To prove the main theorem, we need to introduce group charts.

## H-cocycle

Consider $G \curvearrowright X$. A continuous function $\gamma: H \times X \rightarrow G$ is an $H$-cocycle if it satisfies

$$
\gamma\left(h_{1} h_{2}, x\right)=\gamma\left(h_{1}, \gamma\left(h_{2}, x\right) x\right) \cdot \gamma\left(h_{2}, x\right) \text { for every } h_{1}, h_{2} \text { in } H .
$$

## Group charts

To prove the main theorem, we need to introduce group charts.

## H-cocycle

Consider $G \curvearrowright X$. A continuous function $\gamma: H \times X \rightarrow G$ is an $H$-cocycle if it satisfies

$$
\gamma\left(h_{1} h_{2}, x\right)=\gamma\left(h_{1}, \gamma\left(h_{2}, x\right) x\right) \cdot \gamma\left(h_{2}, x\right) \text { for every } h_{1}, h_{2} \text { in } H .
$$

Remark: every $H$-cocycle induces a family of left actions $H \stackrel{\times}{\curvearrowright} G$

$$
h \cdot x g=\gamma(h, g x) g
$$

## Group charts

To prove the main theorem, we need to introduce group charts.

## H-cocycle

Consider $G \curvearrowright X$. A continuous function $\gamma: H \times X \rightarrow G$ is an $H$-cocycle if it satisfies

$$
\gamma\left(h_{1} h_{2}, x\right)=\gamma\left(h_{1}, \gamma\left(h_{2}, x\right) x\right) \cdot \gamma\left(h_{2}, x\right) \text { for every } h_{1}, h_{2} \text { in } H .
$$

Remark: every $H$-cocycle induces a family of left actions $H \stackrel{x}{\curvearrowright} G$

$$
h \cdot x g=\gamma(h, g x) g
$$

## G-charts

A pair $(X, \gamma)$ is called a $G$-chart of $H$. If every induced action $H \stackrel{X}{\curvearrowright} G$ is free, it is called a free $G$-chart of $H$.

## Group charts

## Example

Let $H \leq G$, then for any $G \curvearrowright X$ if we define:

$$
\gamma(h, x)=h \text { for } x \in X, h \in H
$$

Then $\gamma$ is an $H$-cocycle and $(X, \gamma)$ is a free $G$-chart of $H$.

## Group charts

Let $G=\mathbb{Z}^{2}$ and consider the set of tiles $\Sigma$ :

Let $X \subset \Sigma^{\mathbb{Z}^{2}}$ the set of all configurations such that every outgoing arrow matches with an incoming arrow.

## Group charts

## Group charts

Let $\gamma: \mathbb{Z} \times X \rightarrow \mathbb{Z}^{2}$ be the cocycle such that: $\gamma(1, x)$ is the unit vector represented by the outgoing arrowhead of $x((0,0))$ and $\gamma(-1, x)$ the vector represented by the incoming arrow.

$$
\text { if } x(0,0)=\square \quad \begin{aligned}
\gamma(1, x) & =(0,1) \\
\gamma(-1, x) & =(-1,0)
\end{aligned}
$$

## Group charts

Let $\gamma: \mathbb{Z} \times X \rightarrow \mathbb{Z}^{2}$ be the cocycle such that: $\gamma(1, x)$ is the unit vector represented by the outgoing arrowhead of $x((0,0))$ and $\gamma(-1, x)$ the vector represented by the incoming arrow.

$$
\text { if } x(0,0)=\square \quad \begin{aligned}
\gamma(1, x) & =(0,1) \\
\gamma(-1, x) & =(-1,0)
\end{aligned}
$$

## Example

$(X, \gamma)$ is a $\mathbb{Z}^{2}$-chart of $\mathbb{Z}$. It is not free.

## Group charts

## Group charts

## Group charts

Consider $\widehat{X} \subset X$ be the subshift of $X$ such that no cycles appear.

## Group charts

Consider $\hat{X} \subset X$ be the subshift of $X$ such that no cycles appear.

## Example

$\left(\widehat{X},\left.\gamma\right|_{\mathbb{Z} \times} \hat{X}\right)$ is a free $\mathbb{Z}^{2}$-chart of $\mathbb{Z}$.

## Embedding H -actions

Consider

- A $G$-subshift $X$.
- A G-chart $(X, \gamma)$ of $H$.
- An $H$-subshift $Y$.

## Embedding H -actions

Consider

- A $G$-subshift $X$.
- A G-chart $(X, \gamma)$ of $H$.
- An $H$-subshift $Y$.

## Embedding of $H \curvearrowright Y$ into $(X, \gamma)$

Let $Y_{\gamma}[X]$ be the set of all $(x, y) \in X \times \mathcal{A}^{G}$ such that every copy of $H$ induced by the cocycle $\gamma$ carries a configuration from $Y$.

## Embedding $H$-actions: example

## Example

- The $\mathbb{Z}^{2}$-subshift $\widehat{X}$ from the example before.
- The free $G$-chart $(\hat{X}, \gamma)$ of $H$.
- The $\mathbb{Z}$-subshift consisting of the orbit of the periodic configuration:

## Embedding H-actions: example

## Embedding H-actions: example

## Embedding H -actions: example

## Addition formula

Let $G, H$ be countable amenable groups.

## Theorem (B., 19.)

If $(X, \gamma)$ is a free $G$-chart of $H$, then for every $H$-subshift $Y$,

$$
h_{t o p}\left(G \curvearrowright Y_{\gamma}[X]\right)=h_{\text {top }}(H \curvearrowright Y)+h_{\text {top }}(G \curvearrowright X)
$$

## Addition formula

Let $G, H$ be countable amenable groups.

## Theorem (B., 19.)

If $(X, \gamma)$ is a free $G$-chart of $H$, then for every $H$-subshift $Y$,

$$
h_{\text {top }}\left(G \curvearrowright Y_{\gamma}[X]\right)=h_{\text {top }}(H \curvearrowright Y)+h_{\text {top }}(G \curvearrowright X)
$$

Remark: If both $X$ and $Y$ are SFTs, then $Y_{\gamma}[X]$ is an SFT.

$$
h_{\mathrm{top}}(G \curvearrowright X)+\mathcal{E}_{\mathrm{SFT}}(H) \subset \mathcal{E}_{\mathrm{SFT}}(G)
$$

Goal: Let $G$ be a finitely generated amenable group such that

- $G$ has decidable word problem.
- $G$ admits a translation-like action by $\mathbb{Z}^{2}$.

Then $\mathcal{E}_{\mathrm{SFT}}(G)=\mathcal{E}_{\mathrm{SFT}}\left(\mathbb{Z}^{2}\right)$.

Tool: If $(X, \gamma)$ is a $G$-chart of $H$ and $X$ is an SFT then,

$$
h_{\mathrm{top}}(G \curvearrowright X)+\mathcal{E}_{\mathrm{SFT}}(H) \subset \mathcal{E}_{\mathrm{SFT}}(G)
$$

Goal: Let $G$ be a finitely generated amenable group such that

- $G$ has decidable word problem.
- $G$ admits a translation-like action by $\mathbb{Z}^{2}$.

Then $\mathcal{E}_{\mathrm{SFT}}(G)=\mathcal{E}_{\mathrm{SFT}}\left(\mathbb{Z}^{2}\right)$.

Tool: If $(X, \gamma)$ is a $G$-chart of $H$ and $X$ is an SFT then,

$$
h_{\mathrm{top}}(G \curvearrowright X)+\mathcal{E}_{\mathrm{SFT}}(H) \subset \mathcal{E}_{\mathrm{SFT}}(G)
$$

(1) For which groups $H, G$ are there free $G$-charts $(X, \gamma)$ of $H$ such that $X$ is an SFT.

Goal: Let $G$ be a finitely generated amenable group such that

- $G$ has decidable word problem.
- $G$ admits a translation-like action by $\mathbb{Z}^{2}$.

Then $\mathcal{E}_{\mathrm{SFT}}(G)=\mathcal{E}_{\mathrm{SFT}}\left(\mathbb{Z}^{2}\right)$.

Tool: If $(X, \gamma)$ is a $G$-chart of $H$ and $X$ is an SFT then,

$$
h_{\mathrm{top}}(G \curvearrowright X)+\mathcal{E}_{\mathrm{SFT}}(H) \subset \mathcal{E}_{\mathrm{SFT}}(G)
$$

(1) For which groups $H, G$ are there free $G$-charts $(X, \gamma)$ of $H$ such that $X$ is an SFT.
(2) How to reduce the entropy of such a chart.

Question: For which groups $H, G$ are there free $G$-charts $(X, \gamma)$ of $H$ such that $X$ is an SFT.

Question: For which groups $H, G$ are there free $G$-charts $(X, \gamma)$ of $H$ such that $X$ is an SFT.

## Free charts

Let $H, G$ be finitely generated groups. There exists a free $G$-chart of $H$ if and only if $H$ admits a translation-like action on $G$.

Question: For which groups $H, G$ are there free $G$-charts $(X, \gamma)$ of $H$ such that $X$ is an SFT.

## Free charts

Let $H, G$ be finitely generated groups. There exists a free $G$-chart of $H$ if and only if $H$ admits a translation-like action on $G$.

## Free SFT charts

With the extra hypotheses:

- $H$ is finitely presented.
- There exists a strongly aperiodic H-SFT.

Then the free $G$-chart of $H$ can be chosen as an SFT.
Note: This is essentially due to Jeandel.

## Second issue

Question: How to reduce the entropy of an SFT preserving the cocycle?

## Second issue

Question: How to reduce the entropy of an SFT preserving the cocycle?

## Theorem (B., 19.)

Let $G$ be a countable amenable group and $X$ a G-SFT. For every $\varepsilon>0$ there exists a G-SFT $Y$ such that

- $h_{\text {top }}(G \curvearrowright Y) \leq \epsilon$,
- There exists a continuous G-equivariant map $\phi: Y \rightarrow X$.

## Second issue

Question: How to reduce the entropy of an SFT preserving the cocycle?

## Theorem (B., 19.)

Let $G$ be a countable amenable group and $X$ a G-SFT. For every $\varepsilon>0$ there exists a G-SFT $Y$ such that

- $h_{\text {top }}(G \curvearrowright Y) \leq \epsilon$,
- There exists a continuous G-equivariant map $\phi: Y \rightarrow X$.
"Every SFT contains sofic subsystems which admit an SFT extension with arbitrarily low entropy"

## Second issue: corollaries

## Theorem (B., 19.)

Let $G$ be a countable amenable group and $X$ a G-SFT.
For every $\varepsilon>0$ there exists a G-SFT $Y$ such that

- $h_{\text {top }}(G \curvearrowright Y) \leq \epsilon$,
- There exists a continuous G-equivariant map $\phi: Y \rightarrow X$.

## Second issue: corollaries

## Theorem (B., 19.)

Let $G$ be a countable amenable group and $X$ a G-SFT.
For every $\varepsilon>0$ there exists a G-SFT $Y$ such that

- $h_{\text {top }}(G \curvearrowright Y) \leq \epsilon$,
- There exists a continuous G-equivariant map $\phi: Y \rightarrow X$.

Corollary: Instead of choosing $(X, \gamma)$ take $\left(Y, \gamma^{\prime}\right)$ where $\gamma^{\prime}: H \times Y \rightarrow G$ is given by $\gamma^{\prime}(h, y)=\gamma(h, \phi(y))$.

## Second issue: corollaries

## Theorem (B., 19.)

Let $G$ be a countable amenable group and $X$ a G-SFT.
For every $\varepsilon>0$ there exists a G-SFT $Y$ such that

- $h_{\text {top }}(G \curvearrowright Y) \leq \epsilon$,
- There exists a continuous G-equivariant map $\phi: Y \rightarrow X$.

Corollary: Instead of choosing $(X, \gamma)$ take $\left(Y, \gamma^{\prime}\right)$ where $\gamma^{\prime}: H \times Y \rightarrow G$ is given by $\gamma^{\prime}(h, y)=\gamma(h, \phi(y))$.
"If there exists one SFT chart, then one can find another SFT chart with arbitrarily low entropy "

## Second issue: corollaries

## Theorem (B., 19.)

Let $G$ be a countable amenable group and $X$ a G-SFT.
For every $\varepsilon>0$ there exists a G-SFT $Y$ such that

- $h_{\text {top }}(G \curvearrowright Y) \leq \epsilon$,
- There exists a continuous G-equivariant map $\phi: Y \rightarrow X$.

## Second issue: corollaries

## Theorem (B., 19.)

Let $G$ be a countable amenable group and $X$ a G-SFT.
For every $\varepsilon>0$ there exists a G-SFT $Y$ such that

- $h_{\text {top }}(G \curvearrowright Y) \leq \epsilon$,
- There exists a continuous G-equivariant map $\phi: Y \rightarrow X$.

Corollary: Every G-SFT contains a subshift with zero entropy. In particular, every minimal G-SFT has zero topological entropy.

## Theorem (B., 19.)

Let $G$ be a countable amenable group and $X$ a G-SFT.
For every $\varepsilon>0$ there exists a G-SFT $Y$ such that

- $h_{\text {top }}(G \curvearrowright Y) \leq \epsilon$,
- There exists a continuous G-equivariant map $\phi: Y \rightarrow X$.

Corollary: Every G-SFT contains a subshift with zero entropy. In particular, every minimal G-SFT has zero topological entropy.

Question: Is there a G-SFT which does not contain a zero entropy sub-G-SFT? (I don't know the answer for $G=\mathbb{Z}^{2}$ )

## Theorem (B,. 19.)

Let $G$ be a finitely generated amenable group such that

- G has decidable word problem.
- $G$ admits a translation-like action by $\mathbb{Z}^{2}$.

Then the set of entropies attainable by G-subshifts of finite type is the set of non-negative upper semi-computable numbers.

$$
\mathcal{E}_{S F T}(G)=\mathcal{E}_{S F T}\left(\mathbb{Z}^{2}\right)
$$

## Theorem (B,. 19.)

Let $G$ be a finitely generated amenable group such that

- G has decidable word problem.
- $G$ admits a translation-like action by $\mathbb{Z}^{2}$.

Then the set of entropies attainable by G-subshifts of finite type is the set of non-negative upper semi-computable numbers.

$$
\mathcal{E}_{S F T}(G)=\mathcal{E}_{S F T}\left(\mathbb{Z}^{2}\right)
$$

## proof:

- $\mathbb{Z}^{2}$ is finitely presented and admits strongly aperiodic SFTs. Thus there exists an SFT free $G$-chart $(X, \gamma)$ of $\mathbb{Z}^{2}$.
- For arbitrarily $\varepsilon>0$ we can choose $h_{\text {top }}(G \curvearrowright X) \leq \varepsilon$.
- $h_{\text {top }}(G \curvearrowright X)+\mathcal{E}_{\mathrm{SFT}}\left(\mathbb{Z}^{2}\right) \subseteq \mathcal{E}_{\mathrm{SFT}}(G) \subseteq \mathcal{E}_{\mathrm{SFT}}\left(\mathbb{Z}^{2}\right)$.
- Done.

## Proving the entropy reduction theorem

Remark: This idea fails in a countable amenable group.
(No sequence of subgroups of finite index isomorphic to the original group such that a choice of coset representatives forms a FøIner sequence)

## Proving the entropy reduction theorem

Remark: This idea fails in a countable amenable group.
(No sequence of subgroups of finite index isomorphic to the original group such that a choice of coset representatives forms a FøIner sequence)

Idea: Replace the square by a finite set of sufficiently invariant finite sets which tile the group.

Remark: This idea fails in a countable amenable group.
(No sequence of subgroups of finite index isomorphic to the original group such that a choice of coset representatives forms a FøIner sequence)

Idea: Replace the square by a finite set of sufficiently invariant finite sets which tile the group.

## Tilings of a group (Introduced by Ornstein and Weiss, 87.)

Let $\mathcal{T}=\left\{T_{1}, \ldots, T_{n}\right\}$ be a set of finite subsets of $G$. A tiling of the group is a function $\tau: G \rightarrow \mathcal{T} \cup\{\varnothing\}$ such that:
(1) ( $\tau$ is pairwise-disjoint) For every $g, h \in G$, if $g \neq h$ then $\tau(g) g \cap \tau(h) h=\varnothing$.
(2) $(\tau$ covers $G)$ For every $g \in G$ there exists $h \in G$ such that $g \in \tau(h) h$.

## Proving the entropy reduction theorem

Remark: Given $\mathcal{T}=\left\{T_{1}, \ldots, T_{n}\right\}$. The set of all tilings of $G$ by $\mathcal{T}$ is a G-SFT.

Remark: Given $\mathcal{T}=\left\{T_{1}, \ldots, T_{n}\right\}$. The set of all tilings of $G$ by $\mathcal{T}$ is a G-SFT.

## Theorem (Downarowicz, Huczek and Zhang, 19.)

Let $G$ be a countable amenable group. For any $F \Subset G$ and $\varepsilon>0$ there exists a tile set $\mathcal{T}$ such that:

- Every $T \in \mathcal{T}$ is $(F, \varepsilon)$-invariant,
- There exists a tiling $\tau$ by $\mathcal{T}$ such that the topological entropy of its orbit closure is zero.

Remark: Given $\mathcal{T}=\left\{T_{1}, \ldots, T_{n}\right\}$. The set of all tilings of $G$ by $\mathcal{T}$ is a G-SFT.

Theorem (Downarowicz, Huczek and Zhang, 19.)
Let $G$ be a countable amenable group. For any $F \Subset G$ and $\varepsilon>0$ there exists a tile set $\mathcal{T}$ such that:

- Every $T \in \mathcal{T}$ is $(F, \varepsilon)$-invariant,
- There exists a tiling $\tau$ by $\mathcal{T}$ such that the topological entropy of its orbit closure is zero.

To prove the entropy reduction Theorem, use the set of tiles from the Theorem above instead of the squares.

## Closing remarks

Goal: Study the possible sets $\mathcal{E}_{\text {SFT }}(G)$ for an amenable group.

## Closing remarks

Goal: Study the possible sets $\mathcal{E}_{\mathrm{SFT}}(G)$ for an amenable group.

In this talk:

- Full classification for Polycyclic groups.
- Tools for embedding entropies of one group into another.
- A class of groups with a full classification

## Closing remarks

Goal: Study the possible sets $\mathcal{E}_{\mathrm{SFT}}(G)$ for an amenable group.

In this talk:

- Full classification for Polycyclic groups.
- Tools for embedding entropies of one group into another.
- A class of groups with a full classification

## To keep in mind:

- This is far from a full characterization.

## Closing remarks

Goal: Study the possible sets $\mathcal{E}_{\mathrm{SFT}}(G)$ for an amenable group.

In this talk:

- Full classification for Polycyclic groups.
- Tools for embedding entropies of one group into another.
- A class of groups with a full classification

## To keep in mind:

- This is far from a full characterization.
- Does not cover many solvable groups with decidable word problem. Baumslag-Solitar groups, Lamplighter, etc.

## Thank you for your attention!

Entropies of subshifts of finite type on countable amenable groups
